The invention relates to rat GMI-specific alphal-2fucosyltransferase (alphal-2FucT) enzyme and its corresponding nucleic acid. This nucleic acid is specific for a carbohydrate moiety found in ganglioside GMI, a terminal galactose betal-3R-acetylgalactosamine (Galbetal-3GalNAC) saccharide. Alphal-2FucT DNA is useful for producing rat alphal-2FucT protein by recombinant techniques. Alphal-2FucT DNA is useful for the preparative synthesis of fucosyl containing glycolipids, glycoproteins, glycolipoproteins and oligosaccharide, and for preparing fucosyl-GMI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Rat hepatoma H35 cell alphal-2fucosyltransferase, useful for producing GMI-specific alphal-2fucosyltransferase enzyme by recombinant techniques and for detecting oncogenic transformation of test tissues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rat, alphal-2fucosyltransferase, alphal-2FucT; antisense therapy; galaatose batal.3N-acetylgalaatosamine; Galbetal-3GalNac, glycollpid; gylycoprotein; glycollpoprotein; oligosaccharide; fucosyl-GM1; cancer; gene therapy; oncogenic transformation; cytostatic; ganglioside; GM1;

Since alphal-2FucT is activated in cell transformation, antisense sequences derived from alphal-2FucT DNA are useful for inhibiting, suppressing or treating cancer. Alphal-2FucT DNA is useful in gene therapy and antisense therapy. The present sequence is rat hepatoma H35 cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (SE or FUT2), a type II integral membrane profession affinity of or type I and type III substrates. Its amino acid sequence was deduced from the nucleotide sequence of a genomic DNA clone (see AAV2903) isolated from a pig liver library on the basis of homology to human FUT2 cDNA. Pig FUT2 shows 83.2% identity with human FUT2. Expression of a glycosyltransferase, such as porcine Se, in a tissue results in reduced expression of unwanted carbohydrate epitopes on the tissue, especially porcine heart, liver, kidney or pancreas, rendering it more suitable for transplantation, i.e. less immunogenic and of increased immunological acceptability. A claimed method of producing a cell from a donor species that is immunologically acceptable to a recipient species involves reducing recognised as non-self by the recipient by expressing a nucleic acid for a glycosyltransferase such as porcine Se in the cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ωp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             QY
                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents pig secretor used in an example of the present invention. The present invention describes nucleic acids (NA) encoding a chimaric glycosyltransferase. The NAs comprises a catalytic domain of a first glycosyltransferase (GT) and a localisation signal of a second GT, whereby when the NA is expressed in a cell and where the chimaric enzyme is located in an area of the cell where it is able to compete for substrate with a second GT, resulting in reduced levels of a product from the second GT, The NAs can be used to produce cells and organs with desired glycosylation patterns. Products and methods of the present invention can be used to reduce the levels of undesirable epitopes in cells, tissues or organs which may be used in transplantation or gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 GEYATLFALARMNGRLAFIPASMHNALAPIFRISLPVLHSDTAKKIPWQNYHLNDWMEER 120

This sequence is the human Sec2 protein of the invention. The DNA encodes a alpha(1,2) fucosyltransferase and is the Secretor alpha(1,2)fucosyltransferase locus, that cross Appridises with the H blood group alpha(1,2)fucosyltransferase gene. The DNA is useful for producing a recombinant human GDP-L-fucose:beta-D-galactoside 2-alpha-L-fucosyltransferase (FUT2) which can be used for genotyping an individual as a secretor or nonsecretor as it is known that nonsecretors homozygous for a mutant allele of the FUT2 gene that has a stop codon in the position corresponding to amino acid 143.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence is given in a specification relating to a rat ganglioside GM_1-specific alphal-2fucosyltransferase protein. The protein or its callular fraction is useful for synthesis of a molecule comprising Fucalphal-2Galbetal-3GalNac, a glycolipid, glycoprotein, glycolipoprotein or a free oligosaccharide comprising Fucalphal-2Galbetal-3GalNac.
The method involves contacting alphal-2fucosyltransferase with GDP-fucose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New rat ganglioside GMI-specific alphal-2Fucosyltransferase, useful for preparation of fucosyl GMI which is useful as a nutritional composition or immunotherapeutic for cancer and neurological diseases
                                                                                                                                                                                                                                                                                                                                                                                                                          neuroprotective; nootropic; gene therapy; Fucalphal-2Galbetal-3GalNAc; immunotherapy; immunosuppression; cancer; neurological disease; small cell lung carcinoma.

It is also useful for synthesis of fucosyl-GML! by contacting the protein with GDP-fucose and ganglioside GML! The obtained glycoproteins, glycolipids and oligosaccharides are useful as nutritional compositions and fucosyl-GML! is useful for inducing an immunotherapeutic or immunosuppressive action against cancer, neurological disease or small cell lung carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        LOORIVKLOPLSEKELPMTTOMSSGNTESPEMRRDSEOHGNGELRGMFTINSIGRLGNOM 60

The functional protein is represented by amino acids 33 to 365. The enzyme produced by the DNA sequence can be used in enzymatic fucosylation of chain-terminating galactose residues on lactoseamine or neolacto type beta-D-galactoside to alpha-2-L-fucose residues. The enzyme can be expressed in the milk of a transgenic mammal, esp. cow. This allows large-scale prodn. of oligosaccharides and

The enzyme is responsible for the synthesis of 2'-fucosyllactose, one of the oligosaccharides in human milk. Other products of Fuc-T include glycoprotiens contg. beta-linked terminal galactose residues which can be fucosylated by Fuc-T. This DNA can be used to produce non-human transgenic mammals able to produce secondary gene products, e.g. oligosaccharides, in their milk. The transgenic mammals milk blochemically resembles human milk. This humanised milk can be used in the prepn. of an enteral nutritional product useful in the nutritive maintenance of an animal.
                                                                                                                                                                                                                  262

(AAT01082) isolated from a human epidermal carcinoma cell line A431 cDNA library. The enzyme can be expressed in the milk of a transgenic mammal, esp. cow. This allows large-scale prodn. of oligosaccharides or glycosylated proteins and lipids in the milk.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     203 DRGYLEKALDMFRARYSSPVFVVTSNGMAWCRENINASRGDVVFAGNGIEGSPAKDFALL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The human H-transferase (AAR90572) product of a cDNA clone (AAT12238) prepd. from human epidermoid carcinoma cells (ATCC CRL 155 A-431) can be expressed in xenogeneic organs, tissues and cells using a vector such as pApEx-1 (AAT1239). This results in decreased expression of the non-human antigen galactose alpha(1,3) galactose on the surface of the organs etc. so that hyperacute rejection is reduced upon transplantation to humans.

A carried ranspance and the control of the control of the control of a carried carried calls, the enzyme human GDP-L-fucose: beta-D-galactoside 2-falpha-L-fucosyltransferase (also called alpha 1,2 FT) or human GDP-L-fucose: beta-D-N-acetylalucosamide 3/4-alpha-L-fucosyltransferase (also called alpha 1,3/4 FT). The enzyme is expressed under the control of a gut epithelial cell-specific promoter and Helicobacter pylori adherse to the transgenic cells. The transgenic mouse and intestinal epithelial cells from it are useful as models for screening compounds for the ability to inhibit adhesion of H. pylori to gut epithelial cells. The present sequence represents human alpha 1,2 FT and was published by Larsen et al., Proc.Natl.Acad.Sci.USA, 87:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    202
